

Addendum OS4.0 - OS4.5

IMPORTANT NOTICE

This note is only valid after installing OS4.05

S/T OS Version

On power up, the Virus shows not only the OS version but a little **S** or **T** in the right corner. This letter indicates the hardware revision of your Virus. From the next update on, there will be two different OS files. Please make sure that you install the right file. The procedure is save though, attempts to install an incompatible update will be quit with an error message.

It is important to install the right version of the Virus operating system. In case you attempt to install an incompatible OS version, the Virus cancels installation with an error message.

FIRST_S.MID is to be installed on machines showing an “S” on the right corner of the startup screen.

FIRST_T.MID is to be installed on machines showing an “T” on the right corner of the startup screen.

There is no quality or performance difference in the two hardware revision.

1024 Patches

OS version 4.5 or higher supports 1024 internal sound patches. Overwriting the demo song frees up the necessary space in the flash ROM.

Install OSxx second1024.mid to load the additional patches into your Virus. Details on the installation can be found in the user manual.

NEW FUNCTIONS

Global switches for Arpeggiators and the Delay/Reverb have been included.

Both switches are located in the

CTRL>>>SYSTEM>>> Menu:

ArpGlobal

Enables or disables the arpeggiator globally. The global parameter overwrites the arpeggiator ON/OFF setting of the individual patches.

To emulate the behavior of earlier operating system version, you need to switch ON the option.

```
1 SYSTEM
Arpeggiator  ON◀
```

DelayGlobal

Enables or disables the delay globally. This global parameter overwrites the Delay/Reverb setting of the individual patches.

To emulate the behavior of earlier operating system version, you need to switch ON the option.

```
1 SYSTEM
Delay       ON◀
```

MemProtect

The memory protect parameter has an additional setting called “WARN” (for “warnings”)

OFF Patches and Multis can be stored

ON The Virus is completely memory protected. Patches and multis can't be stored.

WARN Patches and Multis can be stored. Furthermore the “SOUND EDITED! Remember storing” alert in the multimode is disabled. The mode is especially made for live musicians who need to switch in between edited multi settings without warnings.

```
1 SYSTEM
MemProtect WARN
```

MIDI Soft Thru

Soft Thru forwards all MIDI data the Virus receives from the MIDI input to the MIDI output socket. The MIDI data the Virus generates itself are being mixed in. Soft thru is only available with the Virus kb/Indigo

```
1 MIDI
SoftThru OFF
```
